 $F_X : \mathcal{A}/X \to \mathcal{B}/FX$

is a right adjoint. When $\mathcal A$ has 1, it suffices to check this for X=1.

Polynomial functors are l.r.a because for a polynomial p, the composite $\prod_{p_2} \Delta_{p_1}$ may be identified with $\mathbf{P}_{\mathcal{E}}(p)_1$. Notice that the left adjoint to $\mathbf{P}_{\mathcal{E}}(p)_1$ is $\sum_{p_1} \Delta_{p_2}$ which itself preserves connected limits and thus in particular monos.

2-bicategories of polynomials Example The category monad T on **Gph** is l.r.a. but not polynomial over **Gph**. More examples
