# Semialgebraic sets

Given a set of polynomials  $\mathcal{G} = \{g_1, \dots, g_m\}$  we denote

$$S(\mathcal{G}) = \{x \in \mathbb{R}^n : g_1(x) \geq 0, \dots, g_m(x) \geq 0\}.$$

We are interested in approximating convex hulls of these sets.

# Semialgebraic sets

Given a set of polynomials  $\mathcal{G} = \{g_1, \dots, g_m\}$  we denote

$$S(\mathcal{G}) = \{x \in \mathbb{R}^n : g_1(x) \geq 0, \dots, g_m(x) \geq 0\}.$$

We are interested in approximating convex hulls of these sets.

We are particularly interested in the case

$$S(g) = \{x \in \mathbb{R}^n : g(x) \geq 0\}.$$

for some simple instances of  $g$ .

# Sums of Squares

A certificate of nonnegativity on  $S(\mathcal{G})$  for  $p$  is given by a representation

$$p(x) = \sigma_0 + \sum \sigma_i g_i,$$

where the  $\sigma_j$  are sums of squares.

# Sums of Squares

A certificate of nonnegativity on  $S(\mathcal{G})$  for  $p$  is given by a representation

$$p(x) = \sigma_0 + \sum \sigma_i g_i,$$

where the  $\sigma_j$  are sums of squares.

The set of all such polynomials where  $\deg(\sigma_0)$  and  $\deg(\sigma_i g_i)$  are less or equal to  $2k$  is denoted by  $\text{QM}_k(\mathcal{G})$ .

# Convex Hulls of semialgebraic sets

We want to use this tool to approximate  $\text{conv}(S(\mathcal{G}))$ .

# Convex Hulls of semialgebraic sets

We want to use this tool to approximate  $\text{conv}(S(\mathcal{G}))$ . Note that

$$\overline{\text{conv}(S(\mathcal{G}))} = \bigcap_{\ell \text{ linear}, \ell|_{S(\mathcal{G})} \geq 0} \{x \in \mathbb{R}^n : \ell(x) \geq 0\}.$$

# Convex Hulls of semialgebraic sets

We want to use this tool to approximate  $\text{conv}(S(\mathcal{G}))$ . Note that

$$\overline{\text{conv}(S(\mathcal{G}))} = \bigcap_{\ell \text{ linear}, \ell|_{S(\mathcal{G})} \geq 0} \{x \in \mathbb{R}^n : \ell(x) \geq 0\}.$$

We can therefore relax it by

$$\mathcal{L}_k(\mathcal{G}) = \bigcap_{\ell \text{ linear}, \ell \in \text{QM}_k(\mathcal{G})} \{x \in \mathbb{R}^n : \ell(x) \geq 0\}$$

which we call the  **$k$ -th Lasserre Relaxation** of  $S(\mathcal{G})$ .

# Lasserre Relaxation - Example

(Loading...)

$$\mathcal{L}_2(g) \text{ for } g = x(x^2 + y^2) - x^4 - x^2y^2 - y^4.$$

# Plane Quartics

In “On semidefinite representations of plane quartics” Didier Henrion studied some properties of  $\mathcal{L}_k(g)$  for a plane quartic  $g$ .

# Plane Quartics

In “On semidefinite representations of plane quartics” Didier Henrion studied some properties of  $\mathcal{L}_k(g)$  for a plane quartic  $g$ . In particular:

- ▶ If  $S(g)$  has a singularity in its convex boundary,

$$\mathcal{L}_k(g) \neq \text{conv}(S(g))$$

# Plane Quartics

In “On semidefinite representations of plane quartics” Didier Henrion studied some properties of  $\mathcal{L}_k(g)$  for a plane quartic  $g$ . In particular:

- ▶ If  $S(g)$  has a singularity in its convex boundary,

$$\mathcal{L}_k(g) \neq \text{conv}(S(g))$$

- ▶ If  $g$  is concave

$$\mathcal{L}_2(g) = \text{conv}(S(g)).$$

# Plane Quartics

In “On semidefinite representations of plane quartics” Didier Henrion studied some properties of  $\mathcal{L}_k(g)$  for a plane quartic  $g$ . In particular:

- ▶ If  $S(g)$  has a singularity in its convex boundary,

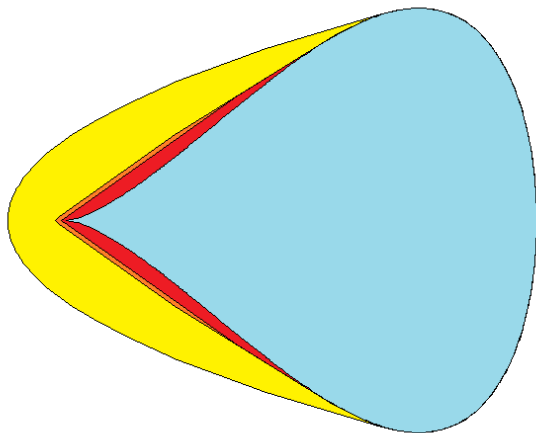

$$\mathcal{L}_k(g) \neq \text{conv}(S(g))$$

- ▶ If  $g$  is concave

$$\mathcal{L}_2(g) = \text{conv}(S(g)).$$

The paper also contains a list of beautiful examples. This talk is in the same spirit.

## Example 1

Relaxations  $\mathcal{L}_2$ ,  $\mathcal{L}_3$  and  $\mathcal{L}_4$  of  $S(-x^4 + x^3 - y^2)$ .

## Example 2

Relaxations  $\mathcal{L}_2$  and  $\mathcal{L}_3$  for  $S(-y(y^2 - x^2) - (x^2 + y^2)^2)$ .

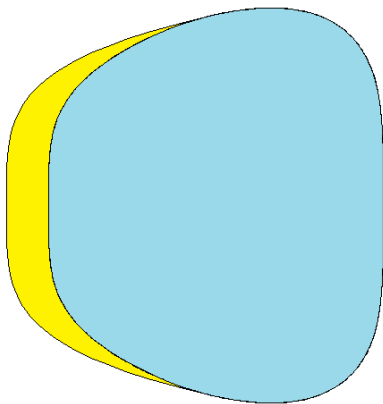

## Example 3

Relaxation  $\mathcal{L}_2$  of  $S(4(x^2 + y^2) - (x^2 + y^2 + 2x)^2)$ .

## Example 4

Relaxation  $\mathcal{L}_2$  of  $S(x + x^2 - 2x^4 - y^4)$ .

## Question

This last case has a convex region with smooth boundary for which  $\mathcal{L}_2$  fails.

## Question

This last case has a convex region with smooth boundary for which  $\mathcal{L}_2$  fails.

What went wrong in this case?

# Question

This last case has a convex region with smooth boundary for which  $\mathcal{L}_2$  fails.

What went wrong in this case?

More generally: can we understand the meaning of  $\mathcal{L}_2(g)$  for a quartic curve?

# Question

What went wrong in this case?

More generally: can we understand the meaning of  $\mathcal{L}_2(g)$  for a quartic curve?

# Smooth quartic revisited

(Loading...)

$\mathcal{L}_2(g_\alpha)$  for  $g_\alpha = (1 - \alpha)x + x^2 - 2x^4 - y^4$ , with  $\alpha \in [0, 1]$ .

# Polynomial Shadow

Given a polynomial  $p(x_1, \dots, x_n)$ , consider its graph

$$G_p = \{(x_0, x) \in \mathbb{R}^{n+1} : x_0 = p(x_1, \dots, x_n)\}.$$

# Polynomial Shadow

Given a polynomial  $p(x_1, \dots, x_n)$ , consider its graph

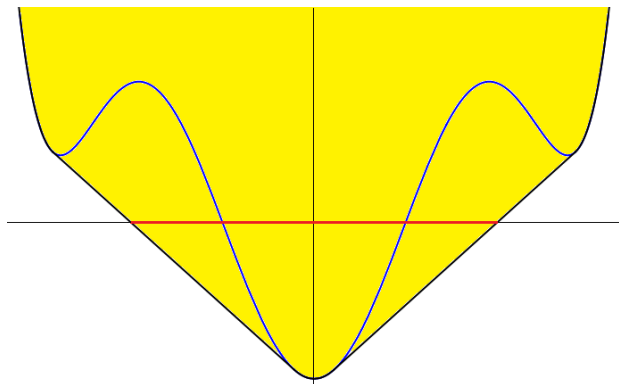

$$G_p = \{(x_0, x) \in \mathbb{R}^{n+1} : x_0 = p(x_1, \dots, x_n)\}.$$

The **shadow** of  $p$ ,  $\text{Sh}(p) \subseteq \mathbb{R}^n$ , is the set

$$\text{Sh}(p) = \{x \in \mathbb{R}^n : (0, x) \in \text{conv}(G_p)\}.$$

## Example

Graph of  $p$  and  $\text{Sh}(p)$  for  $p = -4 + 7x^2 - 2x^4 + 1/6x^6$ .

# Fact

## Simple Fact

If  $p$  has degree  $2d$  then  $\text{Sh}(p) \subseteq \mathcal{L}_d(p)$ .

# Fact

## Simple Fact

If  $p$  has degree  $2d$  then  $\text{Sh}(p) \subseteq \mathcal{L}_d(p)$ .

**Proof:** If  $\ell(x) = \sigma(x) + \lambda p(x)$  then  $\frac{1}{\lambda} \ell(x) - p(x) \geq 0$ .

# Fact

## Simple Fact

If  $p$  has degree  $2d$  then  $\text{Sh}(p) \subseteq \mathcal{L}_d(p)$ .

**Proof:** If  $\ell(x) = \sigma(x) + \lambda p(x)$  then  $\frac{1}{\lambda}\ell(x) - p(x) \geq 0$ .

This implies

$$x_0 - \frac{1}{\lambda}\ell(x) \leq 0$$

is valid in the graph of  $p$ .

# Fact

## Simple Fact

If  $p$  has degree  $2d$  then  $\text{Sh}(p) \subseteq \mathcal{L}_d(p)$ .

**Proof:** If  $\ell(x) = \sigma(x) + \lambda p(x)$  then  $\frac{1}{\lambda}\ell(x) - p(x) \geq 0$ .

This implies

$$x_0 - \frac{1}{\lambda}\ell(x) \leq 0$$

is valid in the graph of  $p$ .

Hence  $\ell(x) \geq 0$  is valid over  $\text{Sh}(p)$ . □

# Scarabeus

Consider  $p = (x^2 - y^2)^2 - (x^2 + y^2)(x^2 + y^2 + 4x)^2$ . This cuts out the scarabeus sextic which does not seem  $\mathcal{L}_3$ -exact.

# Scarabeus

Consider  $p = (x^2 - y^2)^2 - (x^2 + y^2)(x^2 + y^2 + 4x)^2$ . This cuts out the scarabeus sextic which does not seem  $\mathcal{L}_3$ -exact.

To prove it note

$$p(-4, 0) = -256, \quad p(1, 0) = 24 \quad \Rightarrow \quad \left( \frac{4}{7}, 0, 0 \right) \in \text{conv}(G_p).$$

# Scarabeus

Consider  $p = (x^2 - y^2)^2 - (x^2 + y^2)(x^2 + y^2 + 4x)^2$ . This cuts out the scarabeus sextic which does not seem  $\mathcal{L}_3$ -exact.

To prove it note

$$p(-4, 0) = -256, \quad p(1, 0) = 24 \quad \Rightarrow \quad \left(\frac{4}{7}, 0, 0\right) \in \text{conv}(G_p).$$

However,  $\max_{x \in S(p)} = \left(-50 + 11\sqrt{22}\right) / 27 \approx 0.06$ .

## Fact 2

Actually the proof gives us a better result.

### Simple Fact 2

If  $p$  has  $n$  variables and degree  $2d$  where

- ▶  $n = 1$ ;
- ▶  $d = 1$  or
- ▶  $n = 2$  and  $d = 2$ ,

then  $\text{Sh}(p) = \mathcal{L}_d(p)$ .

## Fact 2

Actually the proof gives us a better result.

### Simple Fact 2

If  $p$  has  $n$  variables and degree  $2d$  where

- ▶  $n = 1$ ;
- ▶  $d = 1$  or
- ▶  $n = 2$  and  $d = 2$ ,

then  $\text{Sh}(p) = \mathcal{L}_d(p)$ .

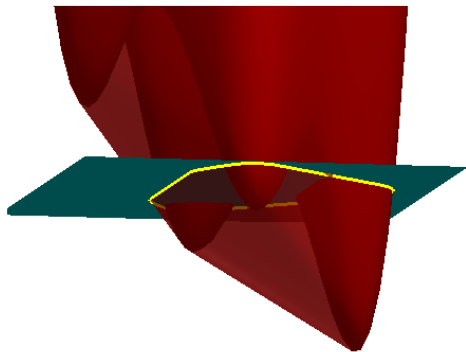

In particular, if  $p$  is a concave planar quartic,  $\mathcal{L}_2(p) = S(p)$ .

## Example

$$\mathcal{L}_2(20x^4 + 85y^2x^2 - 25x^2 - 3x + 20y^4 - 25y^2 + 7).$$

## Example

$$\mathcal{L}_2(20x^4 + 85y^2x^2 - 25x^2 - 3x + 20y^4 - 25y^2 + 7).$$

## Example 2

$$\mathcal{L}_2(4(x^2 + y^2) - (x^2 + y^2 + 2x)^2).$$

## Example 2

$$\mathcal{L}_2(4(x^2 + y^2) - (x^2 + y^2 + 2x)^2).$$

# Univariate quartics

For  $p = -(x - a_1)(x - a_2)(x - a_3)(x - a_4)$ , what is  $\mathcal{L}_2(p)$ ?

# Univariate quartics

For  $p = -(x - a_1)(x - a_2)(x - a_3)(x - a_4)$ , what is  $\mathcal{L}_2(p)$ ?

Consider  $\bar{a}$  the average of  $a_1, a_2, a_3, a_4$ , and define

$$b_1, b_2 = \bar{a} \pm \sqrt{\frac{a_1^2 + a_2^2 + a_3^2 + a_4^2}{4} - \bar{a}^2}.$$

# Univariate quartics

For  $p = -(x - a_1)(x - a_2)(x - a_3)(x - a_4)$ , what is  $\mathcal{L}_2(p)$ ?

Consider  $\bar{a}$  the average of  $a_1, a_2, a_3, a_4$ , and define

$$b_1, b_2 = \bar{a} \pm \sqrt{\frac{a_1^2 + a_2^2 + a_3^2 + a_4^2}{4} - \bar{a}^2}.$$

$\mathcal{L}_2(p) = \text{conv}(S(p))$  iff  $\{b_1, b_2\} \subseteq \text{conv}(\{a_1, a_2, a_3, a_4\})$ .

# Univariate quartics

For  $p = -(x - a_1)(x - a_2)(x - a_3)(x - a_4)$ , what is  $\mathcal{L}_2(p)$ ?

Consider  $\bar{a}$  the average of  $a_1, a_2, a_3, a_4$ , and define

$$b_1, b_2 = \bar{a} \pm \sqrt{\frac{a_1^2 + a_2^2 + a_3^2 + a_4^2}{4} - \bar{a}^2}.$$

$\mathcal{L}_2(p) = \text{conv}(S(p))$  iff  $\{b_1, b_2\} \subseteq \text{conv}(\{a_1, a_2, a_3, a_4\})$ .

Otherwise  $\mathcal{L}_2(p) = \text{conv}(\{a_1, a_2, a_3, a_4, c\})$ , where  $c$  is the  $x$ -intercept of the bitangent at  $\{b_1, b_2\}$ .

# Computing

Given a quartic  $p$ , we can consider the set of points  $w_1, w_2, w \in \mathbb{R}^3$  such that

# Computing

- ▶  $w$  is in the line through  $w_1$  and  $w_2$  and has  $z$ -coordinate 0.

Eliminating all variables but  $w$  we should get a curve containing the boundary of  $\mathcal{L}_2(p)$ .

Unfortunately it has not worked well in practice.

## Teardrop revisited

For the teardrop curve  $x^3 - x^4 - y^2$  we get the boundary curve  
 $-1 - 8x + 64y^2$ .

The end

**Thank You**
