

Shifted tableau crystals

Jake Levinson (SFU)
joint with Maria Gillespie (CSU),
Kevin Purbhoo (Waterloo)

“in Lisbon”
7 December 2020

Ordinary and shifted tableaux

- ▶ Semistandard (skew) tableaux

		1	3
2	2	4	
3			

- ▶ geometry of Grassmannians, rep theory of GL_n and S_n , combinatorics of symmetric functions, jeu de taquin.

- ▶ **Shifted** (skew) tableaux

			1'	1	2'
			1'	2	
		1	1		
			3		

- ▶ Geometry of *odd orthogonal* Grassmannians $OG(2n + 1)$, representation theory of $q(n)$, *projective* S_n representations

Ordinary and shifted tableaux

- ▶ Semistandard (skew) tableaux

		1	3
2	2	4	
3			

- ▶ geometry of Grassmannians, rep theory of GL_n and S_n , combinatorics of symmetric functions, jeu de taquin.

- ▶ **Shifted** (skew) tableaux

			1'	1	2'
			1'	2	
		1	1		
			3		

- ▶ Geometry of *odd orthogonal* Grassmannians $OG(2n + 1)$, representation theory of $q(n)$, *projective* S_n representations
- ▶ Several variants! Schur P-functions \neq Schur Q-functions

Ordinary and shifted tableaux

- ▶ Semistandard (skew) tableaux

		1	3

- ▶ *Geometry of odd orthogonal Grassmannians* $OG(2n+1)$, representation theory of $q(n)$, *projective* S_n representations
- ▶ Several variants! Schur P-functions \neq **Schur Q-functions**
(For us: southwesternmost i/i' is always unprimed.)

From geometry to tableaux...

- ▶ Remarkable story connecting **geometry of curves**, **Schubert calculus**, **tableaux**

[Shapiro–Shapiro, Eisenbud–Harris, Mukhin–Tarasov–Varchenko, Purbhoo, Speyer, Sottile, Halacheva–Kamnitzer–Rybnikov–Weekes, Osserman, White, Chan–López Martín–Pflueger–Teixidor i Bigas, Gillespie–L, **Rodrigues...**]

From geometry to tableaux...

- ▶ Remarkable story connecting **geometry of curves**, **Schubert calculus**, **tableaux**

From geometry to tableaux...

- ▶ Remarkable story connecting **geometry of curves**, **Schubert calculus**, **tableaux**
- ▶ Geometry story:
 - ▶ Define curves in $Gr(k, n)$, $OG(n, 2n + 1)$ by intersecting certain Schubert varieties

- ▶ Monodromy via (shifted) **tableaux** and **tableau algorithms**.

... to more tableaux

- ▶ Monodromy known in type A [Gillespie-L '16] – by jeu de taquin and crystal operators!

... to more tableaux

- ▶ Monodromy known in type A [Gillespie-L '16] – by jeu de taquin and crystal operators!

In type B, rep theory \neq geometry.

($q(n)$ crystals: Grantcharov–Jung–Kang–Kashiwara–Kim '13, Assaf–Oguz '18, Gillespie–Hawkes–Poh–Schilling '18)

... to more tableaux

- ▶ Monodromy known in type A [Gillespie-L '16] – by jeu de taquin and ‘**crystal**’ operators!

In type B, **rep theory** \neq **geometry**.

($q(n)$ crystals: Grantcharov–Jung–Kang–Kashiwara–Kim '13, Assaf–Oguz '18, Gillespie–Hawkes–Poh–Schilling '18)

... to more tableaux

- ▶ Monodromy known in type A [Gillespie-L '16] – by jeu de taquin and ‘**crystal**’ operators!

In type B, **rep theory** \neq **geometry**.

($q(n)$ crystals: Grantcharov–Jung–Kang–Kashiwara–Kim '13, Assaf–Oguz '18, Gillespie–Hawkes–Poh–Schilling '18)

- ▶ Key property: the monodromy operator is **coplactic**: it commutes with all (shifted) jeu de taquin slides.

... to more tableaux

- ▶ Monodromy known in type A [Gillespie-L '16] – by jeu de taquin and ‘**crystal**’ operators!

In type B, **rep theory** \neq **geometry**.

($q(n)$ crystals: Grantcharov–Jung–Kang–Kashiwara–Kim '13, Assaf–Oguz '18, Gillespie–Hawkes–Poh–Schilling '18)

- ▶ Key property: the monodromy operator is **coplactic**: it commutes with all (shifted) jeu de taquin slides.

Question

What are the natural coplactic operators on shifted tableaux?

Natural operations on tableaux – type A

Any coplactic operation is determined by its action on **rectified** tableaux.

Natural operations on tableaux – type A

Any coplactic operation is determined by its action on **rectified** tableaux.

Tableaux of shape $\lambda = (5, 3)$, organized by weight:

1	1	1	1	1
2	2	2		

1	1	1	1	2
2	2	2		

1	1	1	2	2
2	2	2		

Natural operations on tableaux – type A

Any coplactic operation is determined by its action on **rectified** tableaux.

Tableaux of shape $\lambda = (5, 3)$, organized by weight:

$$\emptyset \xleftarrow{E_1} \begin{array}{|c|c|c|c|c|} \hline 1 & 1 & 1 & 1 & 1 \\ \hline 2 & 2 & 2 & & \\ \hline \end{array} \begin{array}{c} \xrightarrow{F_1} \\ \xleftarrow{E_1} \end{array} \begin{array}{|c|c|c|c|c|} \hline 1 & 1 & 1 & 1 & 2 \\ \hline 2 & 2 & 2 & & \\ \hline \end{array} \begin{array}{c} \xrightarrow{F_1} \\ \xleftarrow{E_1} \end{array} \begin{array}{|c|c|c|c|c|} \hline 1 & 1 & 1 & 2 & 2 \\ \hline 2 & 2 & 2 & & \\ \hline \end{array} \xrightarrow{F_1} \emptyset$$

Natural operations on tableaux – type A

Any coplactic operation is determined by its action on **rectified** tableaux.

Tableaux of shape $\lambda = (5, 3)$, organized by weight:

$$\emptyset \xleftarrow{E_1} \begin{array}{|c|c|c|c|c|} \hline 1 & 1 & 1 & 1 & 1 \\ \hline 2 & 2 & 2 & & \\ \hline \end{array} \xrightleftharpoons[E_1]{F_1} \begin{array}{|c|c|c|c|c|} \hline 1 & 1 & 1 & 1 & 2 \\ \hline 2 & 2 & 2 & & \\ \hline \end{array} \xrightleftharpoons[E_1]{F_1} \begin{array}{|c|c|c|c|c|} \hline 1 & 1 & 1 & 2 & 2 \\ \hline 2 & 2 & 2 & & \\ \hline \end{array} \xrightarrow{F_1} \emptyset$$

Action on general tableaux:

$$\emptyset \xleftarrow{E_1} \begin{array}{|c|c|c|c|} \hline 1 & 1 & 1 & 1 \\ \hline 1 & 2 & 2 & 2 \\ \hline \end{array} \xrightleftharpoons[E_1]{F_1} \begin{array}{|c|c|c|c|} \hline 1 & 1 & 1 & 2 \\ \hline 1 & 2 & 2 & 2 \\ \hline \end{array} \xrightleftharpoons[E_1]{F_1} \begin{array}{|c|c|c|c|} \hline 1 & 1 & 1 & 2 \\ \hline 2 & 2 & 2 & 2 \\ \hline \end{array} \xrightarrow{F_1} \emptyset$$

Natural operations on tableaux – type A

Any coplactic operation is determined by its action on **rectified** tableaux.

Tableaux of shape $\lambda = (5, 3)$, organized by weight:

$$\emptyset \xleftarrow{E_1} \begin{array}{|c|c|c|c|c|} \hline 1 & 1 & 1 & 1 & 1 \\ \hline 2 & 2 & 2 & & \\ \hline \end{array} \xrightleftharpoons[E_1]{F_1} \begin{array}{|c|c|c|c|c|} \hline 1 & 1 & 1 & 1 & 2 \\ \hline 2 & 2 & 2 & & \\ \hline \end{array} \xrightleftharpoons[E_1]{F_1} \begin{array}{|c|c|c|c|c|} \hline 1 & 1 & 1 & 2 & 2 \\ \hline 2 & 2 & 2 & & \\ \hline \end{array} \xrightarrow{F_1} \emptyset$$

Action on general tableaux:

$$\emptyset \xleftarrow{E_1} \begin{array}{|c|c|c|c|} \hline 1 & 1 & 1 & 1 \\ \hline 1 & 2 & 2 & 2 \\ \hline \end{array} \xrightleftharpoons[E_1]{F_1} \begin{array}{|c|c|c|c|} \hline 1 & 1 & 1 & 2 \\ \hline 1 & 2 & 2 & 2 \\ \hline \end{array} \xrightleftharpoons[E_1]{F_1} \begin{array}{|c|c|c|c|} \hline 1 & 1 & 1 & 2 \\ \hline 2 & 2 & 2 & 2 \\ \hline \end{array} \xrightarrow{F_1} \emptyset$$

E_i, F_i : treat $i, i+1$ as 1, 2.

Type A crystals

General action of F_1 is nontrivial to describe directly.

Works by a **bracketing rule**:

Type A crystals

General action of F_1 is nontrivial to describe directly.

Works by a **bracketing rule**:

										1
						1	2	2		
1	1	1	1	2						
2	2									

$$\text{word}(T) = \begin{array}{cccccccccccc} 2 & 2 & 1 & 1 & 1 & 1 & 2 & 1 & 1 & 2 & 1 \\ (& (&) &) &) &) & (&) & (& (&) \end{array}$$

Type A crystals

General action of F_1 is nontrivial to describe directly.

Works by a **bracketing rule**:

$$\text{word}(T) = \begin{array}{ccccccccccc} 2 & 2 & 1 & 1 & 1 & 1 & 2 & 1 & 1 & 2 & 1 \\ (& (&) &) &) &) & (&) & (& (&) \end{array}$$

Type A crystals

General action of F_1 is nontrivial to describe directly.

Works by a **bracketing rule**:

$$\text{word}(T) = \begin{matrix} 2 & 2 & 1 & 1 & 1 & 1 & 2 & 1 & 2 & 2 & 1 \\ (& (&) &) &) &) & (&) & (& (&) \end{matrix}$$

Type A crystals

General action of F_1 is nontrivial to describe directly.

Works by a **bracketing rule**:

$$\text{word}(T) = \begin{array}{cccccccccccc} 2 & 2 & 1 & 1 & 1 & 1 & 2 & 1 & 2 & 2 & 1 \\ (& (&) &) &) &) & (&) & (& (&) \end{array}$$

Result:

Type A crystals

$$F_1 = \xrightarrow{\text{red}}, F_2 = \xrightarrow{\text{blue}}$$

(F_i : changes an $i \rightsquigarrow i+1$)

Uniquely determined JD T -invariant **graph structure** on tableaux.

Type B: *Two operations on shifted Q-tableaux*

Shifted tableaux of rectified shape $\sigma = (4, 1)$, by weight:

Type B: *Two operations on shifted Q-tableaux*

Shifted tableaux of rectified shape $\sigma = (4, 1)$, by weight:

1	1	1	1
	2		

1	1	1	2
	2		

1	1	2	2
	2		

1	2'	2	2
	2		

1	1	1	2'
	2		

1	1	2'	2
	2		

Type B: Two operations on shifted Q-tableaux

Shifted tableaux of rectified shape $\sigma = (4, 1)$, by weight:

Type B: Two operations on shifted Q-tableaux

Shifted tableaux of rectified shape $\sigma = (4, 1)$, by weight:

$\sigma = (3)$:

Type B: Two operations on shifted Q-tableaux

Shifted tableaux of rectified shape $\sigma = (4, 1)$, by weight:

$\sigma = (3)$:

By coplacticity: unique operators $\xrightarrow{F_1}$, $\xrightarrow{F_1'}$ on all skew shifted tableaux.

Analog of a bracketing rule: F_i, F'_i

Theorem (Gillespie-L-Purbhoo '17)

*There are direct definitions of F_i, F'_i , depending only on $w = \text{word}(T)$, via **first-quadrant lattice walks**.*

- ▶ A 'doubled' bracketing rule!
- ▶ Allows monodromy computations in $\text{OG}(n, 2n + 1)$ [GLP19]

Analog of a bracketing rule: F_i, F'_i

Theorem (Gillespie-L-Purbhoo '17)

There are direct definitions of F_i, F'_i , depending only on $w = \text{word}(T)$, via **first-quadrant lattice walks**.

- ▶ A 'doubled' bracketing rule!
- ▶ Allows monodromy computations in $\text{OG}(n, 2n + 1)$ [GLP19]

: $\text{word}(T) = 2111'21'12'$.

First-quadrant lattice walks

The **lattice walk** for $w = 211'12'22'1'1'$ ends at the point $(3, 2)$.

'Cancellation' away from the axes.

Example: repeated F_1 , followed by one F'_1 :

Example: repeated F_1 , followed by one F'_1 :

Action of F_1 on words: by transforming **critical strings** near axes.

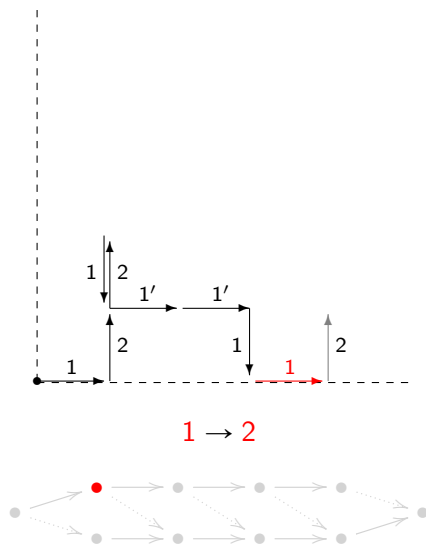

Example: repeated F_1 , followed by one F'_1 :

Action of F_1 on words: by transforming **critical strings** near axes.

Example: repeated F_1 , followed by one F'_1 :

Action of F_1 on words: by transforming **critical strings** near axes.

Example: repeated F_1 , followed by one F'_1 :

Action of F_1 on words: by transforming **critical strings** near axes.

Example: repeated F_1 , followed by one F'_1 :

Action of F_1 on words: by transforming **critical strings** near axes.

Example: repeated F_1 , followed by one F'_1 :

Action of F_1 on words: by transforming **critical strings** near axes.

Example: repeated F_1 , followed by one F'_1 :

Action of F_1 on words: by transforming **critical strings** near axes.

Example: the crystals $\mathcal{B}(\begin{array}{|c|c|c|} \hline \square & \square & \square \\ \hline \square & & \\ \hline \end{array}, 3)$ and $\mathcal{B}(\begin{array}{|c|c|c|} \hline \square & \square & \square \\ \hline \square & \square & \square \\ \hline \square & & \\ \hline \end{array}, 3)$

Legend: $\xrightarrow{F_1}$, $\xrightarrow{F_1'}$, $\xrightarrow{F_2}$, $\xrightarrow{F_2'}$

Features of shifted tableau crystals

Key features:

- ▶ Unique highest-weight element (type B LR tableau)
- ▶ Weighted characters are skew Schur Q-functions
- ▶ Connected components of $\text{ShST}(\lambda/\mu, n)$ recover **skew LR rule** for Schur Q-functions,

$$\text{ShST}(\lambda/\mu, n) \cong \bigsqcup_{\nu} \text{ShST}(\nu, n)^{f_{\nu, \mu}^{\lambda}}$$

$$Q_{\lambda/\mu} = \sum_{\nu} f_{\nu, \mu}^{\lambda} Q_{\nu}.$$

- ▶ Cactus group action by *local reversals* (Rodrigues 2020)

Characterizing the graph structure

- ▶ F_i, F'_i : the **unique** lowering operators on shifted Q-tableaux, coplactic for shifted JDT.
- ▶ Induced graph structure is intrinsic. What is this structure?

Characterizing the graph structure

- ▶ F_i, F'_i : the **unique** lowering operators on shifted Q-tableaux, coplactic for shifted JDT.
- ▶ Induced graph structure is intrinsic. What is this structure?

Theorem (Stembridge '03)

In type A, crystals are characterized by a short list of local graph-theoretic axioms (relating F_i, F_j).

Similar statement for shifted tableau crystals:

Theorem (Gillespie-L '18)

Shifted tableau crystals are characterized by a short list of local graph-theoretic axioms.

Four operators: $F_i, F'_i, F_{i+1}, F'_{i+1} \rightsquigarrow 6$ pairs.

Characterizing the graph structure – type A

Theorem (Stembridge '03)

Local axioms in type A:

Characterizing the graph structure – type A

Theorem (Stembridge '03)

Local axioms in type A:

- ▶ *Some 'basic' rules (vertex weights, ...)*

Characterizing the graph structure – type A

Theorem (Stembridge '03)

Local axioms in type A:

- ▶ Some 'basic' rules (vertex weights, ...)
- ▶ F_i, F_{i+1} relation:

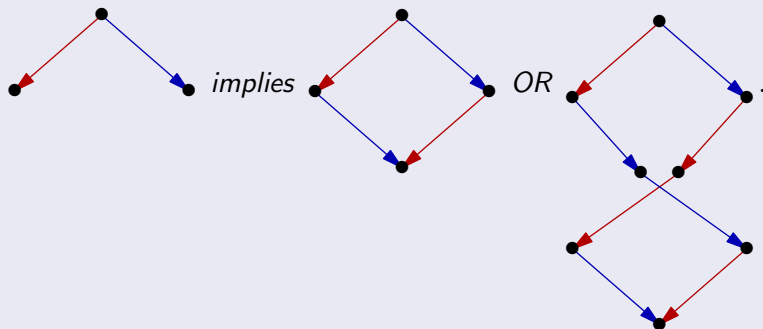

Characterizing the graph structure – type A

Theorem (Stembridge '03)

Local axioms in type A:

- ▶ Some 'basic' rules (vertex weights, ...)
- ▶ F_i, F_{i+1} relation:

(depending on local data).

Axioms for shifted tableau crystals

Theorem (Gillespie-L '18)

Shifted Q -tableau crystals are characterized by a short list of local axioms (relating F_i, F'_i, F_j, F'_j).

Axioms for shifted tableau crystals

Theorem (Gillespie-L '18)

Shifted Q -tableau crystals are characterized by a short list of local axioms (relating F_i, F'_i, F_j, F'_j).

Four operators. Other than $\{F_i, F_{i+1}\}$: they mostly commute.

Axioms for shifted tableau crystals

Theorem (Gillespie-L '18)

Shifted Q-tableau crystals are characterized by a short list of local axioms (relating F_i, F'_i, F_j, F'_j).

Four operators. Other than $\{F_i, F_{i+1}\}$: they mostly commute.

$$\{F'_1, F_1\}, \{F'_1, F'_2\}, \{F'_1, F_2\}, \{F_1, F'_2\}, \{F'_2, F_2\}$$

(Certain specific boundary-case exceptions.)

Axioms for shifted tableau crystals

Theorem (Gillespie-L '18)

Shifted Q-tableau crystals are characterized by a short list of local axioms (relating F_i, F'_i, F_j, F'_j).

Four operators. Other than $\{F_i, F_{i+1}\}$: they mostly commute.

$$\{F'_1, F_1\}, \{F'_1, F'_2\}, \{F'_1, F_2\}, \{F_1, F'_2\}, \{F'_2, F_2\}$$

(Certain specific boundary-case exceptions.)

IDEA: Primed operator F'_i mostly “doubles” the crystal.

Axioms for shifted tableau crystals

The interesting pair: $\{F_1, F_2\}$. *Four* possibilities:

(depending on local data).

“Doubled” axioms from type A.

Using the axioms

Theorem (Gillespie-L '18)

Let G be a graph satisfying the local axioms for shifted tableau crystals. Then each connected component is $\cong \text{ShST}(\sigma, n)$ for some σ .

Gives method to prove positivity of a generating function:

- ▶ Introduce operators F_i satisfying the axioms.

Using the axioms

Theorem (Gillespie-L '18)

Let G be a graph satisfying the local axioms for shifted tableau crystals. Then each connected component is $\cong \text{ShST}(\sigma, n)$ for some σ .

Gives method to prove positivity of a generating function:

- ▶ Introduce operators F_i satisfying the axioms.
- ▶ Done in type A for affine Stanley symmetric functions [Morse-Schilling '15]
- ▶ **Q:** Can this be done for Schur Q positivity?

Using the axioms

Theorem (Gillespie-L '18)

Let G be a graph satisfying the local axioms for shifted tableau crystals. Then each connected component is $\cong \text{ShST}(\sigma, n)$ for some σ .

Gives method to prove positivity of a generating function:

- ▶ Introduce operators F_i satisfying the axioms.
- ▶ Done in type A for affine Stanley symmetric functions [Morse-Schilling '15]
- ▶ **Q:** Can this be done for Schur Q positivity?

Q: Can we use the axioms to compare:

- ▶ Shifted tableau crystals and $q(n)$ crystals? (Schur-P and Schur-Q duality?)
- ▶ Shifted tableau crystals and type A crystals by “flattening”?

Thank you!
