Schanuel's question The aim

Schanuel's question

"Where are negative sets?

Though ill-posed, the question is suggestive; a good answer should complete the diagram

$$\begin{array}{cccc} \mathbb{S} & & \subset & \mathbb{E} \\ \downarrow & & \downarrow \\ \mathbb{N} & & \subset & \mathbb{Z} \end{array}$$

where $\mathbb S$ is the category of finite sets; we seek an enlargement $\mathbb E,$ the isomorphism classes of which should give rise to all integers, rather than just natural numbers."

・ロト ・ 同ト ・ ヨト ・ ヨト

Schanuel's question The aim

Schanuel's question

The answer is negative under some natural assumptions about products, coproducts, and the initial object.

Stephen H. Schanuel, Negative sets have Euler characteristic and dimension, Category Theory, Como 1990, Lecture Notes in Mathematics 1488, Springer, Berlin 1991, 379–385.

• • = • • = •

Schanuel's question The aim

We would like to present a background for constructing a positive answer to Schanuel's question provided we loose only the assumption about the initial object.

Multisets Generalized multisets Example of a generalized multiset Definitions

イロト イポト イラト イラト

Multiset is a set with repeated elements.

Example – the multiset of prime factors of 360:

[2, 2, 2, 3, 3, 5].

Multisets were rediscovered for many times during the history of mathematics. For a survey see:

Wayne Blizard, *The development of multiset theory*, 1991, Modern Logic 1, 319 – 352.

Multisets Generalized multisets Example of a generalized multiset Definitions

イロト イポト イヨト イヨト

Generalized multisets

The first known observation that one can define a generalized multiset with arbitrary integer multiplicities, belongs to Hassler Whitney:

"Suppose we associate with each element of a set R' any integer, positive, negative or zero, instead of merely one or zero. The resulting function will not in general be the characteristic function of a real set; but we may consider it as the characteristic function of a *generalized set*, where each element is counted any number of times."

Hassler Whitney, *Characteristic functions and the algebra of logic*, Annals of Mathematics 34 (1933), 405 – 414.

Multisets Generalized multisets Example of a generalized multiset Definitions

イロト イポト イヨト イヨト

Generalized multisets

Systematic studies in this field started with the works of Wolfgang Reisig, Wayne D. Blizard and Daniel Loeb.

Wolfgang Reisig, *Petri nets, An introduction*, Chapter 9, EATCS Monographs on Theoretical Compututer Science 4, Springer, Berlin 1985.

Wayne D. Blizard, *Negative membership*, Notre Dame Journal of Formal Logic 31 (1990), 346–368.

Daniel Loeb, *Sets with a negative number of elements*, Advances in Mathematics 91 (1992), 64 – 74.

Multisets Generalized multisets Example of a generalized multiset Definitions

イロト イポト イヨト イヨト

Example of a generalized multiset

We have:

$$\frac{360}{539} = \frac{2 \cdot 2 \cdot 2 \cdot 3 \cdot 3 \cdot 5}{7 \cdot 7 \cdot 11}.$$

The multiset of prime factors:

 $[2, 2, 2, 3, 3, 5 \,|\, 7, 7, 11].$

Definitions

A **multiset** in the space *U* is defined by its multiplicity function:

$$\nu\colon U\to\{0,1,2,3,\dots\}.$$

A generalized multiset is defined by a function:

$$\nu: U \to \{\ldots, -3, -2, -1, 0, 1, 2, 3, \ldots\}.$$

Definition Inclusion Intersection Union Three-valued logic

Definition

When we restrict multiplicities to:

1, 0, -1,

we obtain a **generalized set** X which is a pair of disjoint sets (A, B), where A is the positive part and B is the negative one:

$$A = \{ z \in U : \nu_X(z) = 1 \},\$$
$$B = \{ z \in U : \nu_X(z) = -1 \}.$$

マロト イヨト イヨト

Definition Inclusion Intersection Union Three-valued logic

Definition

If
$$A = \{a_1, \ldots, a_m\}$$
 and $B = \{b_1, \ldots, b_n\}$, then we write $X = \{a_1, \ldots, a_m \mid b_1, \ldots, b_n\}.$

The generalized number of elements:

$$|X|_g = m - n.$$

Definition Inclusion Intersection Union Three-valued logic

Inclusion

Inclusion of generalized sets $X \subset_g Y$ is defined by:

$$\forall_{z\in U} \ \nu_X(z) \leqslant \nu_Y(z).$$

Equivalently:

$$\begin{cases} \forall_{z \in U} \ (\nu_X(z) = 1 \Rightarrow \nu_Y(z) = 1) \\ \forall_{z \in U} \ (\nu_Y(z) = -1 \Rightarrow \nu_X(z) = -1). \end{cases}$$

イロト イポト イヨト イヨト

Definition Inclusion Intersection Union Three-valued logic

Inclusion

$$\begin{cases} \forall_{z \in U} \ (\nu_X(z) = 1 \Rightarrow \nu_Y(z) = 1) \\ \forall_{z \in U} \ (\nu_Y(z) = -1 \Rightarrow \nu_X(z) = -1) \end{cases}$$

Given generalized sets

$$X = (A, B), \quad Y = (C, D),$$

where $A \cap B = \emptyset$, $C \cap D = \emptyset$, then:

$$(A,B) \subset_g (C,D) \Leftrightarrow A \subset C \land D \subset B.$$

Definition Inclusion Intersection Union Three-valued logic

Intersection

Intersection of generalized sets X, Y:

$$u_{X\cap_g Y}(z) = \min(\nu_X(z), \nu_Y(z)), \quad z \in U.$$

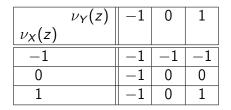

We have a table:

	$\nu_{Y}(z)$	-1	0	1
$\nu_X(z)$				
-1		-1	-1	-1
0		-1	0	0
1		-1	0	1

Easy way –
$$\mathbb{N} \times \mathbb{N}$$

Recall the inclusion:

$$(A,B) \subset_{g} (C,D) \Leftrightarrow A \subset C \land D \subset B.$$

If we define maps between finite generalized sets X = (A, B), Y = (C, D), where $A \cap B = \emptyset$, $C \cap D = \emptyset$, as pairs of maps

$$A \to C, \quad D \to B,$$

then the equivalence classes will be $\mathbb{N} \times \mathbb{N}$.

Easy way – $\mathbb{N}\times\mathbb{N}$ Instantiation of Schanuel's question Two questions

4 日 2 4 周 2 4 月 2 4 月 2 4

Instantiation of Schanuel's question

Is it possible to define in some natural way maps between finite generalized sets in order to obtain a category extending the category of finite sets, where (A, B) are (C, D) isomorphic if and only if

|A| - |B| = |C| - |D|?

Easy way – $\mathbb{N}\times\mathbb{N}$ Instantiation of Schanuel's question Two questions

イロト イポト イラト イラト

If we define maps between finite generalized sets X = (A, B), Y = (C, D), where $A \cap B = \emptyset$, $C \cap D = \emptyset$, as

$$A\sqcup C\to B\sqcup D,$$

then there arize problems with compositions.

Easy way – $\mathbb{N}\times\mathbb{N}$ Instantiation of Schanuel's question Two questions
