# Outline

- ▶ Lenses: symmetric and asymmetric
- ▶ Cospans and symmetric lenses
- ▶ Universality and compatibility

# Lens

- ▶ Consider model domains  $\mathbf{X}, \mathbf{Y} \dots$  of *model states*
- ▶ Model states  $X, Y$  might be:  
elements of a set, of an order, objects of a category
- ▶ *Synchronization data* (various encodings) specifies *consistency* between an  $\mathbf{X}$  state and a  $\mathbf{Y}$  state
- ▶ **Lens**  $L : \mathbf{X} \longrightarrow \mathbf{Y}$  is an example of a so-called *Bidirectional Transformation (BX)* and has both:
  - ▶ *synchronization data* and
  - ▶ *consistency restoration* or *re-synchronization* operator(s) responding to state change.

# Lens

- ▶ *Symmetric* and *asymmetric* cases arise with different, but related, motivation...
- ▶ **Asymmetric**: Only one non-trivial restoration operator returns **X** (global) state change after **Y** (local) change: the motivating example: database view updates
- ▶ **Symmetric**: Concurrent models with bidirectional (two-way) re-synchronization: **X** and **Y** peers  
motivating example: database interoperation

In more detail...

## Symmetric lens

Consistency data (synchronization) for states  $X$  in  $\mathbf{X}$  and  $Y$  in  $\mathbf{Y}$  denoted by  $R : X \leftrightarrow Y$ .

Suppose  $X$  synchronized with  $Y$  by  $R : X \leftrightarrow Y$ ,  
then given an *update* from state  $X$  (with target  $X'$ , say)

a *symmetric lens* delivers an **update** to  $Y$  (target  $Y'$ , say)  
and, **re-synchronization**  $R' : X' \leftrightarrow Y'$ .

$$X \xleftrightarrow{R} Y$$

## Symmetric lens

Consistency data (synchronization) for states  $X$  in  $\mathbf{X}$  and  $Y$  in  $\mathbf{Y}$  denoted by  $R : X \leftrightarrow Y$ .

Suppose  $X$  synchronized with  $Y$  by  $R : X \leftrightarrow Y$ ,  
then given an *update* from state  $X$  (with target  $X'$ , say)

a *symmetric lens* delivers an **update** to  $Y$  (target  $Y'$ , say)  
and, **re-synchronization**  $R' : X' \leftrightarrow Y'$ .

$$\begin{array}{ccc} X & \xleftrightarrow{R} & Y \\ \alpha \downarrow & & \\ X' & & \end{array}$$

## Symmetric lens

Consistency data (synchronization) for states  $X$  in  $\mathbf{X}$  and  $Y$  in  $\mathbf{Y}$  denoted by  $R : X \leftrightarrow Y$ .

Suppose  $X$  synchronized with  $Y$  by  $R : X \leftrightarrow Y$ ,  
then given an *update* from state  $X$  (with target  $X'$ , say)

a *symmetric lens* delivers an **update** to  $Y$  (target  $Y'$ , say)  
and, **re-synchronization**  $R' : X' \leftrightarrow Y'$ .

$$\begin{array}{ccc} X & \xleftrightarrow{R} & Y \\ \alpha \downarrow & \mathbf{f} & \downarrow \beta \\ X' & \longrightarrow & Y' \end{array}$$

# Symmetric lens

Consistency data (synchronization) for states  $X$  in  $\mathbf{X}$  and  $Y$  in  $\mathbf{Y}$  is denoted by  $R : X \leftrightarrow Y$ .

Suppose  $X$  synchronized with  $Y$  by  $R : X \leftrightarrow Y$ ,  
then given an *update* from state  $X$  (with target  $X'$ , say)

a *symmetric lens* delivers an **update** to  $Y$  (target  $Y'$ , say)  
and, **re-synchronization**  $R' : X' \leftrightarrow Y'$ .

$$\begin{array}{ccc} X & \xleftrightarrow{R} & Y \\ \alpha \downarrow & \mathbf{f} \longrightarrow & \downarrow \beta \\ X' & \xleftrightarrow{R'} & Y' \end{array}$$

## Symmetric lens

*Symmetrically*, suppose  $R : X \leftrightarrow Y$ , then given an *update* from  $Y$  (with target  $Y'$ ) symmetric lens delivers update of  $X$  in  $\mathbf{X}$  and *re-synchronization*  $R'' : X' \leftrightarrow Y'$ .

$$\begin{array}{ccc} X & \xleftrightarrow{R} & Y \\ \delta \downarrow & \mathbf{b} & \downarrow \gamma \\ X' & \xleftrightarrow{R''} & Y' \end{array}$$

- ▶ Considered by Hoffman, Pierce, Wagner for  $\mathbf{X}, \mathbf{Y} \dots$  sets
- ▶ More recently Diskin et al. for  $\mathbf{X}, \mathbf{Y} \dots$  categories
- ▶ Also studied by J & R

## Symmetric lens

Formally, taking categories  $\mathbf{X}, \mathbf{Y}$  for model domains:

A **symmetric lens**  $L = (\delta_X, \delta_Y, \mathbf{f}, \mathbf{b})$  from  $\mathbf{X}$  to  $\mathbf{Y}$  has a span of sets

$$\delta_X : |\mathbf{X}| \longleftarrow \mathbf{R}_{\mathbf{X}\mathbf{Y}} \longrightarrow |\mathbf{Y}| : \delta_Y$$

where elements of  $\mathbf{R}_{\mathbf{X}\mathbf{Y}}$  are denoted  $R : X \leftrightarrow Y$  and *forward* and *backward propagations*  $\mathbf{f}, \mathbf{b}$  denoted

$$\begin{array}{ccc} X & \xleftarrow{R} & Y \\ \alpha \downarrow & \mathbf{f} & \downarrow \beta \\ X' & \xleftarrow{R'} & Y' \end{array} \qquad \begin{array}{ccc} X & \xleftarrow{R} & Y \\ \delta \downarrow & \mathbf{b} & \downarrow \gamma \\ X' & \xleftarrow{R''} & Y' \end{array}$$

where  $\mathbf{f}(\alpha, R) = (\beta, R')$  and  $\mathbf{b}(\gamma, R) = (\delta, R'')$

and both propagations respect identities and composition.

Aside:  $\mathbf{f}, \mathbf{b}$  are *Mealy morphisms* in  $\mathbf{cat}$  (noted by Bob Paré)

Examples: To come, but first...

## Asymmetric lens: Background

Arose as strategy for solving the database View Update Problem, actually defined well before symmetric lenses.

- ▶ Defined equationally by Pierce et al when  $\mathbf{X}, \mathbf{Y}$  are sets
- ▶ (Equivalent) axioms from Hegner when  $\mathbf{X}, \mathbf{Y}$  are orders
- ▶ J & R considered for  $\mathbf{X}, \mathbf{Y}$  categories, then
  - ▶ defined asymmetric lens *in* category  $\mathcal{C}$  with finite products
  - ▶ characterized lens as algebra for a monad on  $\mathcal{C}/\mathbf{Y}$
  - ▶ generalized to a categorical version (c-lenses, to come).
- ▶ Diskin et al. defined (related) *asymmetric d-lenses*

Also arose in considering “abstract models of storage”  
(where there is a similar update problem)

## Asymmetric lens: Motivation

Database *view* considered a *get* process  $G : \mathbf{X} \rightarrow \mathbf{Y}$   
full database states  $\mathbf{X}$  to view states  $\mathbf{Y}$ .

For global state  $X$  *synched* with view state  $Y = GX$ :  
when can update to  $Y$ , e.g. formal insertion  $\beta$   
*lift through*  $G$  to global update  $\alpha$ , and  
compatibly – meaning  $\beta = G(\alpha)$ ?

This is (an instance of) the **View Update Problem**.

## Asymmetric lens

Given an *update* from state  $Y = GX$  in  $\mathbf{Y}$  (with target  $Y'$ ) the asymmetric lens delivers (by a “putback” process  $P$ ) an **update** to  $X$  in  $\mathbf{X}$  (with target  $X'$ ) *along with compatible re-synchronization* data, that is  $Y' = GX'$ .

$$\mathbf{X} \xrightarrow{G} \mathbf{Y}$$

## Asymmetric lens

Given an *update* from state  $Y = GX$  in  $\mathbf{Y}$  (with target  $Y'$ ) the asymmetric lens delivers (by a “putback” process  $P$ ) an **update** to  $X$  in  $\mathbf{X}$  (with target  $X'$ ) *along with compatible re-synchronization* data, namely  $Y' = GX'$ .

$$\begin{array}{ccc} \mathbf{X} & \xrightarrow{G} & \mathbf{Y} \\ & & \downarrow \beta \\ & & \mathbf{Y}' \end{array}$$

## Asymmetric lens

Given an *update* from state  $Y = GX$  in  $\mathbf{Y}$  (with target  $Y'$ ) the asymmetric lens delivers (by a “putback” process  $P$ ) an **update** to  $X$  in  $\mathbf{X}$  (with target  $X'$ ) *along with compatible re-synchronization* data, namely  $Y' = GX'$ .

$$\begin{array}{ccc} X & \xrightarrow{G} & Y \\ \alpha \downarrow & P \longleftarrow & \downarrow \beta \\ X' & & Y' \end{array}$$

## Asymmetric lens

Given an *update* from state  $Y = GX$  in  $\mathbf{Y}$  (with target  $Y'$ ) the asymmetric lens delivers (by a “putback” process  $P$ ) an **update** to  $X$  in  $\mathbf{X}$  (with target  $X'$ ) *along with compatible re-synchronization* data, namely  $Y' = GX'$ .

$$\begin{array}{ccc} X & \xrightarrow{G} & Y \\ \alpha \downarrow & P & \downarrow \beta \\ X' & \dashrightarrow & Y' \end{array}$$

## Asymmetric d-lens

The formal axioms are:

An **asymmetric d-lens** is  $L = (G, P)$

where  $G : \mathbf{X} \rightarrow \mathbf{Y}$  is the “Get” functor and  $P$  is the “Put(back)” function and the data  $G, P$  satisfy:

- (i) PutGet:  $GP(X, \beta) = \beta$
- (ii) PutId:  $P(X, 1_{GX}) = 1_X$
- (iii) PutPut:

$$\begin{array}{ccc}
 \mathbf{X} & \xrightarrow{G} & \mathbf{Y} \\
 \swarrow & \downarrow \alpha & \downarrow \beta \\
 \mathbf{X}' & \xleftarrow{P} & \mathbf{Y}' \\
 \swarrow & \downarrow \alpha' & \downarrow \beta' \\
 \mathbf{X}'' & \xleftarrow{P} & \mathbf{Y}'' \\
 & \downarrow G & \\
 & & \mathbf{Y}''
 \end{array}
 \quad \begin{array}{l}
 \alpha = P(X, \beta) \\
 \alpha' = P(X', \beta')
 \end{array}$$

or

$$P(X, \beta' \beta : GX \rightarrow Y' \rightarrow Y'') = P(X', \beta' : GX' \rightarrow Y'') P(X, \beta : GX \rightarrow Y')$$

## Asymmetric d-lens: examples

- ▶ Given a split op-fibration  $G : \mathbf{X} \longrightarrow \mathbf{Y}$ :  
Just define  $P(X, \beta)$  to be the op-Cartesian arrow.
- ▶ For example,  $d_0 : \mathbf{set}^2 \longrightarrow \mathbf{set}$  or  $d_1 : \mathbf{set}^2 \longrightarrow \mathbf{set}$
- ▶ Or  $V : \mathbf{C} \longrightarrow \mathbf{D}$  a small fully-faithful functor,  
 $V^* : \widehat{\mathbf{D}} \longrightarrow \widehat{\mathbf{C}}$  is an opfibration
- ▶ This class called “c-lenses” by J & R and studied earlier  
(in the context of View Update Problem)
  - ▶ defined by equations analogous to asymmetric **set**-lens
  - ▶ algebras for a monad on **cat**/**Y**
  - ▶ the Put satisfies a “least change” property (to come)
- ▶ Indeed, an asymmetric *d-lens* is an algebra for a related *semi*-monad on **cat**/**Y**
- ▶ Note: *not every* asymmetric d-lens is an op-fibration

## Symmetric lens and asymmetric d-lens

- ▶ Symmetric lenses compose, so do the asymmetric for set-based, category-based and other variants.  
NB: Lenses are the *morphisms*.
- ▶ *Span* of asymmetric d-lenses determines a symmetric lens:  
roughly: the **f** is the left leg Put, then the right leg Get
- ▶ Symmetric lens determines a span of asymmetrics  
roughly: head of span has squares w top/bottom *Rs*
- ▶ Both have composition-compatible behaviour equivalence relations, that define suitable categories for an...

## Symmetric lens and asymmetric d-lens

- ▶ Equivalence of categories from symmetric lenses to spans of asymmetrics
- ▶ The (asymmetric) c-lens special case has universality: the lifted updates are “least change” (to come)
- ▶ Question: what should “least change” mean for an arbitrary *symmetric* lens?
- ▶ Suggestion: a span of asymmetric, least change (c-)lenses??  
*But not likely*: the head of the span is under-specified.

## Construction

Motivated by database interoperation/integration as implemented along a *common view*, we construct:

A *symmetric lens*  $L$  from a *cospan* of asymmetric d-lenses:

$$\mathbf{X} \xrightarrow{(G_L, P_L)} \mathbf{V} \xleftarrow{(G_R, P_R)} \mathbf{Y}$$

Set  $L = (\delta_{\mathbf{X}}, \delta_{\mathbf{Y}}, \mathbf{f}, \mathbf{b}) : \mathbf{X} \longrightarrow \mathbf{Y}$  where

- ▶  $\mathbf{R}_{\mathbf{X}\mathbf{Y}} = \{(X, Y) \mid G_L X = G_R Y = V\}$
- ▶  $\delta_{\mathbf{X}}$  and  $\delta_{\mathbf{Y}}$  projections from  $\mathbf{R}_{\mathbf{X}\mathbf{Y}}$  to  $|\mathbf{X}|$  and  $|\mathbf{Y}|$ , and

## Construction...

- ▶  $\mathbf{f}(\alpha, (X, Y)) = (P_R(Y, G_L(\alpha)), (X', Y'))$  as in

$$\begin{array}{ccc} X & \xrightarrow{V} & Y \\ \alpha \downarrow & & \downarrow P_R(Y, G_L(\alpha)) \\ X' & \xrightarrow{V'} & Y' \end{array}$$

$Y' := d_1 P_R(Y, G_L(\alpha))$  and as  $G_R(P_R(Y, G_L(\alpha))) = G_L(\alpha)$  we denote  $V' = d_1 G_L(\alpha)$ .

- ▶ Definition of  $\mathbf{b}$  is similar.

## Construction: Example

Recall that  $d_1, d_0 : \mathbf{set}^2 \rightarrow \mathbf{set}$  are both Gets for asymmetric d-lens (even c-lens), with Puts from op-cartesian arrows.

Consider the construction for the cospan:

$$d_1 : \mathbf{set}^2 \rightarrow \mathbf{set} \longleftarrow \mathbf{set}^2 : d_0$$

Let  $X, Y$  be objects of  $\mathbf{set}^2$  with a synchronization

$$R : X_1 = d_1 X = d_0 Y = Y_0,$$

$$\begin{array}{c} X_0 \\ \downarrow x \\ X_1 \end{array}$$

$$\begin{array}{c} Y_0 \\ \downarrow y \\ Y_1 \end{array}$$

## Construction: Example

Recall that  $d_1, d_0 : \mathbf{set}^2 \rightarrow \mathbf{set}$  are both Gets for asymmetric d-lens (even c-lens), with Puts from op-cartesian arrows.

Consider the construction for the cospan:

$$d_1 : \mathbf{set}^2 \rightarrow \mathbf{set} \leftarrow \mathbf{set}^2 : d_0$$

Let  $X, Y$  be objects of  $\mathbf{set}^2$  with a synchronization

$$R : X_1 = d_1 X = d_0 Y = Y_0,$$

## Construction: Example

Recall that  $d_1, d_0 : \mathbf{set}^2 \rightarrow \mathbf{set}$  are both Gets for asymmetric d-lens (even c-lens), with Puts from op-cartesian arrows.

Consider the construction for the cospan:

$$d_1 : \mathbf{set}^2 \rightarrow \mathbf{set} \leftarrow \mathbf{set}^2 : d_0$$

Let  $X, Y$  be objects of  $\mathbf{set}^2$  with a synchronization

$$R : X_1 = d_1 X = d_0 Y = Y_0,$$

and if  $(f_0, f_1) : X \rightarrow X'$  a left side update, as in

## Construction: Example

Forward propagation constructs a new arrow  $(f_1, g) : Y \rightarrow Y'$  using the pushout, together with a new synch  $R' : X'_1 = d_0 Y'$ :

## Construction: Example

For example: a left hand db state assigns *name* to *address*;  
a right hand state assigns *address* to *city*;  
so a synchronization is an *address* matching

*name/address* update propagates to a right hand update,  
also creating a new *city* set: the pushout

# Compatibility 1

$G_L$  and  $G_R$  in the construction define a cospan of object functions, so *at most one synchronization* for a pair  $X$  and  $Y$ : the object  $V$  of  $\mathbf{V}$  both  $X$  and  $Y$  map to.

The cospan similarly defines a relation from *arrows* of  $\mathbf{X}$  to *arrows* of  $\mathbf{Y}$ , compatible with synchronization:

## Definition

In a cospan of asymmetric d-lenses

$$\mathbf{X} \xrightarrow{(G_L, P_L)} \mathbf{V} \xleftarrow{(G_R, P_R)} \mathbf{Y}$$

arrows  $\alpha$  of  $\mathbf{X}$  and  $\beta$  of  $\mathbf{Y}$  are called **compatible** if  $G_L(\alpha) = G_R(\beta)$ .

# Universality

In case  $(G_L, P_L)$  and  $(G_R, P_R)$  are *c-lenses*, we find a *universal property* for the  $\mathbf{f}$  and  $\mathbf{b}$  constructed above.

First, notation: to  $\alpha : X \longrightarrow X'$  and synchronization  $(X, Y) = V$ :  
Write  $\mathbf{f}(\alpha, (X, Y)) = (\mathbf{f}(\alpha, V)_0, \mathbf{f}(\alpha, V)_1)$   
with two components, as in the square.

$$\begin{array}{ccc} X & \xrightarrow{V} & Y \\ \alpha \downarrow & & \downarrow \mathbf{f}(\alpha, V)_0 \\ X' & \xrightarrow{\mathbf{f}(\alpha, V)_1} & Y' \end{array}$$

# Universality

The universal property satisfied by  $\mathbf{f}(\alpha, (X, Y))$ :

## Proposition

Given a cospan of  $c$ -lenses  $\mathbf{X} \xrightarrow{(G_L, P_L)} \mathbf{V} \xleftarrow{(G_R, P_R)} \mathbf{Y}$  and  $\alpha : X \rightarrow X'$  and  $V = (X, Y)$ . Then, for any  $\beta : Y \rightarrow Y''$  compatible with  $\alpha$  there is a unique  $\beta' : Y' \rightarrow Y''$  satisfying  $\beta = \beta' \mathbf{f}(\alpha, V)_0$  and  $G_R(\beta') = 1_{G_L X'}$ .

## Remarks

- ▶ Thus among arrows with domain  $Y$  *compatible* with  $\alpha$ ,  $\mathbf{f}(\alpha, (X, Y))_0$  is the **least-change** arrow
- ▶ That is, other compatible updates factor through  $\beta$  via *arrow compatible with the identity on  $X'$*
- ▶ Similarly for  $\mathbf{b}$
- ▶ *Spans* of c-lenses determine relations on objects of  $\mathbf{X}$  and  $\mathbf{Y}$  but with no obvious universal property
- ▶ And what about more general symmetric lenses...?

## Compatibility 2

- ▶ When is a symmetric lens “least change”?
- ▶ We'll require not just a synchronization of objects but also a compatibility for arrows of  $\mathbf{X}$  and the arrows of  $\mathbf{Y}$ .
- ▶ In forward (or backward) propagation square, the left & right arrows surely must be compatible, so

### Definition

Let  $L = (\delta_{\mathbf{X}}, \delta_{\mathbf{Y}}, \mathbf{f}, \mathbf{b})$  be a symmetric lens from  $\mathbf{X}$  to  $\mathbf{Y}$  with  $\mathbf{R}_{\mathbf{X}\mathbf{Y}}$ . A **compatibility relation**  $C$  on  $L$  from arrows  $\mathbf{X}$  to arrows of  $\mathbf{Y}$ :

- contains the union of pairs from  $\mathbf{f}$ -squares and  $\mathbf{b}$ -squares, and
- if  $\alpha C \beta$ , there are  $R_0, R_1$  in  $\mathbf{R}_{\mathbf{X}\mathbf{Y}}$  with  $R_0 : d_0(\alpha) \leftrightarrow d_0(\beta)$ , and for  $d_1$

## Least change lens

### Definition

A symmetric lens  $L$  equipped with a compatibility relation  $C$  is called **least-change** if for  $\alpha : X \rightarrow X'$  and  $R : X \leftrightarrow Y$  we have  $\mathbf{f}(\alpha, R)$  satisfies the following:

For  $\beta : Y \rightarrow Y''$  compatible w  $\alpha$  there is unique  $\beta' : Y' \rightarrow Y''$  with  $\beta = \beta' \mathbf{f}(\alpha, R)_0$  and  $1_{X'} C \beta'$  :

And similarly for back propagation **b**.

## Remarks

- ▶ So least-change symmetric lens with compatibility relation has **f** and **b** satisfying the universal property from cospans of c-lenses:
- ▶ Least-change arises from conditions a symmetric lens *with compatibility* may satisfy, *not* just a property of a cospan of c-lenses
- ▶ Question: What least-change symmetric lenses have compatibility from a cospan of asymmetric d-lenses, and when from a cospan of c-lenses?
- ▶ Question: Symmetric lens always corresponds to a span of asymmetric d-lenses; when does a least change compatibility relation arise from the span?

A symmetric lens with compatibility relation is **represented** by a span or cospan of asymmetric d-lenses if forwards and backwards propagations have the same effects *and* the synchronization, and the compatibility relations are the same.

## Complete compatibility

Not every symmetric lens can be represented by a cospan of asymmetric d-lenses:

Relation  $R$  from  $A$  to  $B$ , is called **complete** if it has a complete bipartite graph.

### Proposition

*The compatibility relation from a cospan of asymmetric d-lenses is a coproduct of complete relations.*

*But, this strong condition is not always satisfied.*

## Conclusion

- ▶ Symmetric lenses from c-lens *spans* do not characterize universality
- ▶ Proposal above for *least change* symmetric lens
- ▶ Symmetrics from c-lens *cospans* are least change
- ▶ We have necessary conditions for least change symmetric lenses, but...
- ▶ Characterization question remains open.
